

Data for Development

Technical Cooperation Programme

Nuclear science and technology provide unique and accurate data for sustainable development. From analyzing water in glaciers, rivers and the ocean to monitoring animal disease outbreaks and food fraud, nuclear scientists are able to shed light on complex issues, providing countries with precise scientific data for informed decision-making. The IAEA helps its Member States to apply nuclear science to generate, store and share this valuable data. The IAEA also maintains a number of topic-specific databases to help countries track changes over time and across regions.
